## POWER TURN-ON

**CAUTION** - This game must be plugged into a properly-grounded outlet to prevent shock hazard and to ensure proper game operation. DO NOT use a “cheater” plug to defeat the ground pin on the line cord, and DO NOT cut off the ground pin.

**WHEN THE GAME IS FIRST TURNED ON** it produces a sound. Simultaneously general illumination should come on and a moment later a scanning “rug pattern” indicating the RAM test should appear on the screen. Next the rug should become stationary as the ROM test is performed. In a correctly-running game the rug pattern will be followed by the message “INITIAL CHECKS INDICATE ALL SYSTEMS GO”. If RAM or ROM failure messages come up on the screen instead, refer to Power-Up Tests in TROUBLESHOOTING PROCEDURES.

## GAME OPERATION

**GAME START** - Insert coins; a random sound is produced and credits are displayed on the CRT. With two or more credits displayed, pressing **2-player start** initiates a 2-player game where each player gets five* mounts (turns).

---

*adjustable feature
PLAYER CONTROLS

THE JOYSTICK sends the gladiator and his ever-stalwart mount (ostrich or stork) boldly to the left or to the right.

THE FLAP BUTTON causes the hero's mount to spread its robust wings.

GAME PLAY

AT SOME FAR-DISTANT TIME two fantastic gladiators meet and square off for battle. Each is mounted on a fanciful bird of prey (ostrich or stork) whose wings can carry it from the clifftops to the mouth of the abyss and hopefully back... or the bubbling lava below will increase its toll.

While your mount is a skilled flyer, your opponent is a shrewd gladiator. You must prove you are his better. Stealthily you must pilot your mount above him, and cleverly you must stalk him... to strike at the moment in which he least suspects you! And always remember this rule: In every joust, the highest lance wins.

Of course your opponent will resist your attempts, all the while pursuing his own designs against you. Each gladiator has five* mounts. Every time you're toppled, you must mount a new bird for the next joust. The gladiator who scores the most dismountings is the winner.

YOUR PATH MAY SEEM CLEAR and your work cut out, but just then a flock of vicious Buzzard-Riders will ambush you! Ruthless even as they are dismounted, these wily Buzzard-Riders instantly lay their eggs. You must pick up the eggs or they will soon hatch into even more persistent and antagonistic foes!

Fortunately at 20,000* points (should you make the grade) you will be awarded another bird to mount against the loyal opposition.

Joust is designed for either one or two players.

HIGH SCORE SIGNATURE

Select letters with the joystick. Push right to move forward through the alphabet; push left to move backward. Then push the FLAP button to lock in the letter.

BOOKKEEPING AND EVALUATION TOTALS

1. In Game-Over Mode, open the cashbox and depress the cashbox advance switch. The advance switch located on the coin door can also be used. (See Figure 1.) The CRT should indicate all bookkeeping and evaluation totals. If so, go to step 3. If the CRT display comes up in the ROM test, perform step 2.

![Figure 1. Coin Door Button Switches](image)

2. Continue to depress the cashbox advance switch, stepping the game through test programs for ROMs, RAMs, CMOS RAM, sounds, switches, color RAMs, and then CRT test patterns, of which there are five. The fifth test pattern, color bars, directly precedes the CRT display of the bookkeeping and evaluation totals.

3. The bookkeeping and evaluation totals appear on the displays as in Figure 2.

* adjustable feature
**CLEARING BOOKKEEPING TOTALS**

1. Depress ADVANCE to display Game Adjustments.
2. Operate PLAYER 1 joystick to position cursor on CLEAR BOOKKEEPING TOTALS.
3. Push PLAYER 2 joystick.
4. Depress ADVANCE.

**BOOKKEEPING TOTALS**

*Figure 2. Bookkeeping Display*

**GAME ADJUSTMENTS**

*In the Game-Over Mode open the coin door. With the AUTO-UP/MANUAL-DOWN switch set to AUTO-UP, depress the coin door ADVANCE switch twice to cause a CRT display as shown in Figure 3.*

Select the function you wish to change by moving the PLAYER 1 joystick (push right to move arrow down, left to move arrow up). Then, making sure the coin door is open, push the PLAYER 2 joystick right to increase or left to reduce the value of the selected function.

The number of turns (men) per 1-credit game can be set anywhere from 1 to 99 (5 recommended). Difficulty is factory-programmed at 5 (moderate). It can be custom programmed (0-9, with 9 conservative) as desired.

Game Pricing is selected with standard settings or with custom settings as shown in Tables 1 & 2. Table 1 lists some common pricing schemes and directs the reader to the proper entry in Table 2, which shows what the CRT display should look like to accomplish the desired pricing. Note that free play can be elected by entering the code number 9 at the PRICING SELECTION function (see Tables 1 and 2).

For standard settings you need change only the PRICING SELECTION. For custom settings, first set PRICING SELECTION to zero and then set the remaining values according to Table 2.
# Game Adjustments

![Adjustment Table]

---

**Highest Score Signature**
The number of letters allowed the highest-scoring player for entering his name can be varied from 3 to 20 and is recommended as 3. If objectionable words are entered as the signature name, you can change the lettered entry leaving the highest score the same. See Setting Highest Score Name.

**Restore Factory Settings**
1. Position the cursor on RESTORE FACTORY SETTINGS.
2. Push PLAYER 2 joystick to right.
3. Depress ADVANCE switch twice.

**Resetting High Score Table**
1. Position the cursor on RESET HIGH SCORE TABLE.
2. Push PLAYER 2 joystick to right.
3. Depress ADVANCE.

**Setting Attract Mode Message**
1. Position the cursor on SET ATTRACT MODE MESSAGE.
2. Push PLAYER 2 joystick to right.
3. Depress ADVANCE.
4. Enter up to two lines of your message following instructions on the screen.
5. Depress ADVANCE to terminate process.

**NOTE:**
To restore the Williams attract mode message, perform steps 1 through 3 and then turn the game OFF and back ON.

**Setting Highest Score Name**
1. Position the cursor on SET HIGHEST SCORE NAME.
2. Push PLAYER 2 joystick to right.
3. Depress ADVANCE.
4. Enter new signature; depress ADVANCE to terminate process.

**NOTE:**
An alternate, simpler method enters the factory highest score signature. In the Game Over mode, hold HIGH SCORE RESET depressed. After a few seconds a sound is produced and the factory highest score signature has been activated.

6
TROUBLESHOOTING PROCEDURES

Certain types of game malfunctions may inhibit the game's diagnostic or display facilities. Troubleshooting procedures for most of these types of malfunctions as well as malfunctions that permit self-diagnosis are covered below. Our troubleshooting algorithm begins with Power-Up and continues until Game Over Mode. All procedures can be performed with minimal test equipment or merely by observing the game itself.

POWER-UP TESTS

<table>
<thead>
<tr>
<th>NO GENERAL ILLUMINATION</th>
<th>NO INITIAL VIDEO (RUG PATTERN)</th>
<th>CHECKING POWER SUPPLY BOARD</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Check fuse F2 on power supply board.</td>
<td>(1) Open back doors. (2) Press reset button on CPU Board. (3) Try RAM and ROM tests (see below). (4) If all the above don't turn up the problem, check power supply board.</td>
<td>(1) Swap power supply board with one from known-good game. (2) If game plays, problem is on power supply board. (3) If game doesn't play, check power transformer with voltmeter. (4) If known-good power supply is unavailable for tests above, check +5V, -5V and +12V outputs on power supply in game. Each MUST BE within 2% of rated output with less than 0.1% AC hum.</td>
</tr>
<tr>
<td>(2) Check for proper installation of jumpers W1, W2, W3 and/or resistor R27. (Some machines MAY NOT have an R27. Refer to your drawing set.)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(3) Check 4P1/1J1, 4P3/1J3, 6P2/1J2 and 6P3/1J3.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(4) If all the above don't turn up the problem, check power supply board.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<td></td>
<td>(1) scanning rug pattern (2) blank screen instead of “INITIAL TESTS INDICATE ALL SYSTEMS GO” (3) high score table with no scores (4) intro blank or program crash</td>
<td>(1) Turn power off. (2) To find bad chip, replace 2 special chips one at a time with known good chips. (3) Turn machine on after each replacement and run through Power-Up Tests.</td>
</tr>
</tbody>
</table>
**+5VDC ADJUSTMENT (R10 & R24)**

**Before adjusting the voltage output,** always check at the output of the supply for AC hum. This hum should never rise above .005V on the +5VDC supply. If it does, consult your schematic drawing set for proper DC voltages throughout the circuit. Test for these with the DC setting of your multimeter. Make a second check using the AC setting. Pay particular attention to readings at TP5 (top of capacitor C10). If the voltage here is low (less than +11VDC) or if you find excessive ripple (more than 700mVrms), replace the capacitor.

<table>
<thead>
<tr>

<tr>
<td>TO DECREASE VOLTAGE IF OVER 5.25VDC . . .</td>
<td>add R10</td>
<td>—</td>
<td>remove R24 or add R10</td>
<td>remove R24</td>
</tr>
</tbody>
</table>

**SELF-DIAGNOSTICS**

If RAM or ROM failure messages are displayed on the CRT after the "rug pattern," proceed with self-diagnosics. Self-diagnostic procedures are controlled by the AUTO-UP/MANUAL-DOWN and ADVANCE switches on the coin door. (See Figure 1.) Set the AUTO-UP/MANUAL-DOWN switch to the MANUAL-DOWN position and depress the ADVANCE pushbutton. The game is now in its **Diagnostic Mode** and a ROM test is performed. With ROM test results present on the CRT display, set the AUTO-UP/MANUAL-DOWN switch to the AUTO-UP position. Depressing the ADVANCE pushbutton initiates the RAM test. Further tests (CMOS, sound, switch, color RAM and monitor test patterns) are encountered one after the other as the ADVANCE pushbutton is depressed (once more for each subsequent test).

**MONITOR TEST PATTERNS** - For ease in monitor adjustments, the monitor may be slid back and the screen viewed in the CRT mirror provided on the inside-top of the cabinet. Remove the two bolts and carefully slide the monitor back in its shelf. Secure the monitor in the extended position by inserting the two bolts through holes provided at the left side of the monitor.

**AUTO CYCLE MODE** - From the color bar pattern (or Game Over with the switch set to AUTO-UP) depress ADVANCE two times to display GAME ADJUSTMENTS.

1. Position the cursor on AUTO CYCLE with the PLAYER 1 joystick and push the PLAYER 2 joystick right.
2. Depress ADVANCE.
3. The system will now sequence through ROM, RAM, and CMOS RAM tests repeatedly. The coin door must be open during the Auto Cycle test. If an error is detected, the test is terminated and the failure indication is displayed on the CRT.
4. To terminate the Auto-Cycle test, turn the game OFF and ON.

**3K(31)**

**LEGEND:** FIRST DESIGNATION (3K) IS CIRCUIT BOARD GRID REFERENCE. DESIGNATION IN PARENTHESIS DENOTES BANK NO. (1-3) AND CHIP NO. (1-8).

---

• LOW—check jacks, foils  
• STILL LOW—perform ROM BOARD checkbox below |
| SR1 DIP resistors R3-R9 | VOM-reading ohms (game off) | • ALL 4.7K—proceed  
• ANY OPEN—replace SR1 |
| C3-C9 | VOM-reading ohms (game off) | • ALL OKAY—proceed  
• ANY SHORTED—replace bad |
| [IC5-1, IC7-14 (power pins)] | logic probe (game on and in Test 4) | • HIGH—proceed  
• LOW—replace C19 (IC5) or C21 (IC7)  
• STILL LOW—replace bad IC |
| [IC5-2, 4, 6, 10, 12, 15: IC7-4, 6] | logic probe (game on and in and Test 4) | • PULSING—proceed  
• LOW—replace chip |
| [IC10-18 and 19 (PIA)] | logic probe (game on and in Test 4) | • PULSING—proceed  
• LOW—replace IC  
• ALL LOW—lift C31, retest  
• PULSING NOW—replace C30  
• STILL LOW—replace IC6, retest |
| [IC10-10 to 17 (PIA)] | logic probe (game on and in Test 4) | • PULSING—proceed  
• SOME LOW—replace IC  
• ALL LOW—lift C31, retest  
• PULSING NOW—replace C31  
• STILL LOW—replace IC |
| **SOUND WHEN DIAGNOSTIC PUSHBUTTON PRESSED BUT NOT IN DIAGNOSTIC MODE TEST 4** | **CHECK ROM BOARD OUTPUTS**  
(1) If you hear game sounds, disconnect and then reconnect Sound Board connector 10P3/J3.  
(2) You should hear one or more game sounds. If so, put game in Diagnostic Mode Test 4 and proceed with this checkbox. If not, go ahead to POWER SUPPLY checkbox below. |  
| **TEST** | **TOOL** | **CONDITION & REMEDY** |
| ROM Board connector 2P4/J4-3 to 6 | logic probe (game on and in Test 4) | • PULSING—repair cable to Sound Board  
• ANY LOW—repair jack or foil, proceed |
| 0C DIP resistors 2 to 6 | VOM-reading ohms (game off) | • ALL 4.7K—proceed  
• ANY OPEN—replace 0C |
| C26-39 | VOM-reading ohms (game off) | • ALL OKAY—proceed  
• ANY SHORTED—replace bad |
| ICIC-10 to 15 (PIA) | logic probe (game on and in Test 4) | • PULSING—proceed  
• SOME LOW—replace IC  
• ALL LOW—lift C31, retest  
• PULSING NOW—replace C31  
• STILL LOW—replace IC |
| **NO SOUND** | **CHECK ON-BOARD POWER SUPPLY**  
(1) With power off, test for fuse continuity at F1 and F2.  
(2) With power on, check for +12V unregulated DC at TP1 and TP5 of IC1.  
(3) Now check for +5V regulated DC between TP4 and TP3. If voltages are absent or low, turn off game and lift one pin of filter capacitors C25, C26 and C27.  
(4) Check each with ohmmeter for possible shorts.  
(5) If capacitors are good and unregulated voltages test okay but you're missing +5V, replace regulator chip (IC8). |  
| **STILL NO SOUND** | **CHECK AUDIO (ANALOG) SECTION**  
(1) Turn power on, turn up volume control. Momentarily place powered-up AC soldering pencil on final amplifier's input pin (IC1, pin 1 or 10P4, pin 2). If you hear hum, audio IC, volume pot and speaker are okay.  
(2) Repeat test at Q2 emitter. If you hear hum, analog section is okay. Step (1) will also work if you simply touch amplifier's input pin. However output level of hum will be much lower than with soldering iron. DO NOT use a soldering pencil of over 40 watts. Cordless models will NOT work here. |  
| **MISSING SOUNDS; NO SOUND** | **CHECK SOUND ROM 12 AND RELATED CIRCUITRY**  
(1) Is jumper W1 connected? IT SHOULD BE on all Joust games, or sound signals from the D/A converter (IC13) will never arrive at input of impedance-matching transistor Q2.  
(2) Turn power on.  
(3) If you have no game sounds but power supply tests show normal voltages and no ripple on +5V, check crystal clock circuit. Using DVM or logic probe, test for pulsing AC across crystal. If clock signal's absent, replace crystal and associated capacitors.  
(4) Turn power off.  
(5) Swap sound ROM (IC12) and then microprocessor chip (IC9) with known-good chips.  
(6) Power-up and test Sound Board after each swap by pushing DIAGNOSTIC button. |
CMOS RAM Data Test Protocol

The first sub-test of the CMOS RAM data is that of the ATTRACT MODE MESSAGE checksum. If the test does not pass, the factory ATTRACT MODE MESSAGE is restored. Next, the game adjustments are checked and restored to factory settings if an error is found. If game adjustments are found intact, the high score table is checked for any bad entries. Bad entries are replaced with a score of 4,000 points and no initials. If all entries check, the game returns to the Game Over Mode.

If game adjustments are restored to factory settings, the AUDIT TOTALS are checked. If 5 or more audit digits are other than 0-9 (that is hexadecimal A through F) all audit totals are cleared. This is followed by a check of the high score table and the table is reset to factory settings if errors are found. Finally, game adjustments are rechecked and either OPEN COIN DOOR or FACTORY SETTINGS RESTORED is displayed. With the former, open the coin door and turn the game OFF and ON and then FACTORY SETTINGS RESTORED will be displayed. Return to game over by depressing the ADVANCE pushbutton or by turning the game OFF and ON a second time.

Warning.—This equipment generates, uses, and can radiate radio frequency energy and if not installed and used in accordance with the instructions manual, may cause interference to radio communications. It has been tested and found to comply with the limits for a Class A computing device pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to correct the interference.
